                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  67942,

New RecA mutant proteins comprising a single mutation or a double mutation, useful for catalyzing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment.

Claim 13; SEQ ID NO 3; 34pp; English.

The invention relates to an isolated RecA mutant protein, where the protein is either a single mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant RecA protein comprising a deletion of amino acid residues from the carboxyl

12-DEC-2002; 2002US-0432758P.

```
terminus and an amino acid change from a glutamate to a basic amino acid.

The invention also relates to a polynucleotide sequence that encodes the secA mutant protein, a method of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions comprising providing an amount of the RecA mutant protein and a method of increasing recombination efficiency of homologous DNA pairing and DNA strand exchange reactions in a cell comprising supplying to the cell an amount of the RecA mutant protein as comprises an enhanced capacity to displace a DNA binding protein as compared to wild-type RecA. The DNA binding protein is the ssDNA binding protein from Escherichia coli (SSB). It also comprises enhanced binding to DNA during a DNA strand exchange reaction as compared to wild-type RecA. The composition and methods are useful for catalysing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment. These may be used in promoting in vitro alterations of genes to permit the rapid construction of desired gene mutants for industrial and pharmaceutical purposes. The mutant protein may also be used in targeting the site-specific cleavage of small and large DNAs, or as a basis for the design and construction of tiny electronic circuits based on DNA. This sequence represents a RecA mutant protein of the invention.

RecA; DNA binding protein; ssDNA binding protein; SSB; DNA strand exchange reaction; site-specific cleavage; mutant; mutein. ADR16428 standard; protein; 335 AA E. coli RecA mutant protein #1. 11-DEC-2003; 2003US-00733782 (first entry) Escherichia coli US2004157248-A1 04-NOV-2004 ADR16428; ADR16428

```
The invention relates to an isolated RecA mutant protein, where the protein is either a single mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus, or a double mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus and an amino acid change from a glutamate to a basic amino acid. The invention also relates to a polymucleotide sequence that encodes the RecA mutant protein, a method of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions comprising providing an amount of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein comprises an enhanced capacity to a cell comprising supplying to the cell an amount of the RecA mutant protein comprises an enhanced capacity to binding protein is the sBDNA binding protein from Escherichia coli (SSB). Creaction as compared to wild-type RecA. The DNA binding protein is the sBDNA binding protein from Escherichia coli (SSB). Creaction as compared to wild-type RecA. The Composition and methods are useful for catalysing homologues DNA pairing and DNA strand exchange creactions in an in vitro or in vivo environment. These may be used in promoting in vitro alterations of genes to permit the rapid construction of dessited gene mutants for industrial and pharmaceutical purposes. The compositic altersations of seal and pharmaceutical purposes. The compositic circuits based on DNA. This sequence represents a RecA mutant protein conting based on DNA. This sequence represents
                                                                                                                                                                                                                                                                                   New RecA mutant proteins comprising a single mutation or a double mutation, useful for catalyzing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment.

The invention features to an isolate according to protein is either a single mutant RecA mutant protein, where the protein is either a single mutant RecA mutant protein of amino acid residues from the carboxyl terminus, or a double mutant RecA protein comprising a deletion of amino acid residues from the carboxyl terminus and an amino acid change from a glutamate to a basic amino acid. Terminus and an amend of catalysing an in vitro homologous DNA pairing and DNA strand exchange reactions comprising providing an amount of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein and a method of increasing recombination of the RecA mutant protein and a method of increasing recombination of file RecA mutant protein as comprises an enhanced capacity to a cell comprising supplying to the cell an amount of the RecA mutant protein as comprises an enhanced capacity to displace a DNA binding protein from Escherichia coli (SSB). It also comprises enhanced binding to DNA during a DNA strand exchange reaction as compared to wild-type RecA. The composition and methods are useful for catalysing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment. These may be used in creations in an in vitro or in vivo environment. These may be used in creations in an in vitro or in vivo environment. These may be used in creations of desired gene mutants for industrial and pharmaceutical purposes. The mutant proteins may also be used in trargeting the site-specific cleavage of small and large DNAs, or as a based on DNA. This sequence represents the wild-cype RecA protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New RecA mutant proteins comprising a single mutation or a double mutation, useful for catalyzing homologous DNA pairing and DNA strand exchange reactions in an in vitro or in vivo environment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invention relates to an isolated RecA mutant protein, where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 352;

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (3) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening
                                                                                                                                                                                                                                                                                                                                                                                        Zyskind JW;

```
the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for dentifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the traget prockaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 recA; hyperrecombinogenic variant; male gamete; female gamete; heat tolerance; ethanol production; ethanol tolerance; metabolite; taxol; cyclosporin A; erythromycin; meiosis.

The present sequence represents the recA protein. The wild type recA protein was used to produce hyperrecombinogenic variants (see AAY68928-23), using the method of the invention. The specification describes a method for producing a library of diverse multicellular organisms using pools of male and female gametes. At least one of the male pool or female pools comprises a number of different spacies. The wishe pool or female pools comprises a number of different species. The vishe organisms of a species or of a different species. The vishe organisms or produced from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property such as heat tolerance, ethanol production or tolerance, acid, improved production and maintenance of enzyme cofactors or NAD(P)H and improved glucose transport. The desired property may be expression of a protein or primary or secondary metabolite. Alternatively the desired companies or compatibility to form a heterokaryon with another

The present sequence represents a hyperrecombinogenic recA protein. The wild type recA protein (AAY68827) was used to produce hyperrecombinogenic variants using the method of the invention. The specification describes a method for producting a library of diverse multicallular organisms using pools of male and female gametes. At least one of the male pool or female pools of male and female gametes. At least one of the male pool or female pools comprises a number of a different species. The viable organisms to produce from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property such as heat tolerance, ethanol production or tolerance, acid, improved production and maintenance of enzyme cofactors or NAD(P)H and improved glucose transport. The desired property may be expression of a property is secretion of a protein or primary or secondary metabolite. Alternatively the desired property as secretion of a protein or secondary metabolite, chosen from taxol, cyclosporin A and erythromycin. The desired property may be a comparing to compatibility to form a heterokaryon with another

WPI; 2004-507924/49. N-PSDB; ADQ87817. Evolving cells to acquire a desired property, by forming protoplasts of different cells, fushing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells.

Disclosure; Fig 13; 196pp; English.

The invention relates to a method of evolving cells to acquire a desired property by forming protoplasts of different cells, fusing the protoplasts to form hybrid protoplasts, incubating the hybrid protoplasts to produce regenerated cells, repeatedly forming protoplasts from to produce regenerated cells, repeatedly forming protoplasts from cegenerated cells, fusing protoplasts to form hybrid protoplasts in which genomes from protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional cegenerated cells. The invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of cegenerated cells. The invention also relates to a method of producing a library of diverse several different gametes derived from the female pool of different species or different species and the male gametes ceferilise the female gametes to grow into reproductively viable cresulting fertilise the female gametes to grow into reproductively viable cresulting fertilise to diverse organisms and selecting the library for a produce a library of diverse organisms and selecting the library for a corganism trapeated properties such as heat tolerance, ethanol production, cethanol tolerance, improved production and maintenance of enzyme cofactors, improved production and maintenance of wall improved

glucose transport. The desired property is the expression of a protein, primary metabolite or secondary metabolite, the secretion of a protein or secondary metabolite or capacity for meiosis or compatibility to form a heterokaryon with another strain. The secondary metabolite is chosen from taxol, cyclosporin A and erythromycin. The method is also useful for acquisition of desired properties such as enhanced recombinogenicity, gene copy number or gene reductivity and capacity for expression and/or secretion of proteins or secondary metabolites. The method is further useful for predicting efficacy of a drug in treating viral infection, plant genome shuffling, micropore manipulation, producing transgenic animals, improvement of overexpressed genes for a desired phenotype and relevantive pooling and breeding of higher organisms. The cells evolved by the method are useful in molecular genetics. This sequence represents an E. coli recA protein clone used in the method of the invention.

(MAXY-) MAXYGEN INC.

The invention relates to a method of evolving cells to acquire a desired property by forming protoplasts of different cells, fusing the protoplasts to form hybrid protoplasts, incumbating the hybrid protoplasts from to produce regenerated cells, repeatedly forming protoplasts from coproplasts tecombine to form additional hybrid genomes and genomes from protoplasts recombine to form additional hybrid genomes and cincubating additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional protoplasts from male generated cells. The invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of alterent gametes one of the male pool or the female pool comprises several different species and the male gometes certilise the female gametes, where one of the male pool or certilise the female gametes or different species and the male gametes or certilise the female gametes or different species and the male gametes or sepation of a species or different species and the male gametes or sepatedly crossing the reproductively viable organisms to produce a library of diverse organisms and selecting the library for a desired trait or property. The methods are useful for evolving cells to crossing train or property in methods are useful for evolving cells to confactors, improved production and maintenance of enzyme coffection, improved production and maintenance of enzyme coffectors, improved production and maintenance of enzyme coffering the nethod secondary metabolite, capacity for metosis or compatibility, to form a certain improved production and maintenance of enzyme corpusing condary metabolite, capacity for metosis or compatibility, or gene reductivity and capacity for expression and or exercition of gene reductivity and capacity for expression and or secondary metabolites. The method is also useful for predicting efficacy of a drug in treating viral infection, the intensity of enganism or secondary metabolite and properties such a sequence represents Evolving cells to acquire a desired property, by forming protoplasts of different cells, fushing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells. olecular genetics. The invention relates to a method of evolving cells to acquire a desired property by forming protoplasts of different cells, fusing the protoplasts to form hybrid protoplasts, incubating the hybrid protoplasts to protoplasts from to produce regenerated cells, repeatedly forming protoplasts from to produce regenerated cells, respectedly forming protoplasts from cegenomes from protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional protoplasts recombine to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional protoplasts several different commerced of the male pool of regenerated cells. The invention also relates to a method of producing a library of diverse wulticellular organisms involving providing a pool of the female gametes to grow into reproductively viable creulting fertilised gametes to grow into reproductively viable creulting fertilised gametes to grow into reproductively viable organisms to grodure a library of diverse organisms and selecting the library for a desired trait or property. The methods are useful for evolving cells to acquire desired properties such as heat tolerance, ethanol production, chance transport. The desired property is the expression of a protein or secondary metabolite or secondary metabolite, capacity for meiosis or compatibility to form a secondary metabolite, rapacity for meiosis or compatibility to form a secondary metabolite is chosen from the exercise or a protein or secondary metabolite is ensembled as a protein or secondary metabolite or secondary metabolite is chosen from the exercise or organisms. The method is also useful for the condition and maintenance or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metabolite or secondary metab

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      rech; hyperrecombinogenic variant; male gamete; female gamete;
heat tolerance; ethanol production; ethanol tolerance; metabolite; taxol;
cyclosporin A; erythromycin; meiosis.
            gene copy number or gene reductivity and capacity for expression and/or secretion of proteins or secondary metabolites. The method is further useful for predicting efficacy of a drug in treating viral infection, plant genome shuffling, micropore manipulation, producing transgenic animals, improvement of overexpressed genes for a desired phenotype and reiterative pooling and breeding of higher organisms. The cells evolved by the method are useful in molecular genetics. This sequence represents the E. coli recA protein used in the method of the invention.

                                                                                                                                                                    The present sequence represents a hyperrecombinogenic recA protein. The wild type recA protein (AAY68827) was used to produce hyperrecombinogenic variants, using the method of the invention. The specification describes as method for producing a library of diverse multicellular organisms using pools comprises a number of different gametes derived from different pools comprises a number of different species. The wiable organisms produced from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property. The methods can be used to evolve cells to acquire a desired improved production and maintenance, ethanol production or tolerance, acid, improved production and maintenance of enzyme coffactors or NAD(P)H and improved production and maintenance of enzyme coffactors or NAD(P)H and

The present invention provides methods employing iterative cycles of recombination and selection/screening for evolution of whole cells and organisms toward acquisition of desired properties, e.g. enhanced recombinosenicity, genome copy number, and capacity for expression and/or secretion of proteins and secondary metabolites. The present sequence represents a wild-type rech procein (designated new Minshall), from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Evolution of whole cells and organisms by recursive DNA sequence recombination in cells to evolve cells having acquired desired function, useful in methods for predicting the efficacy of a drug in treating viral or pathogenic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TGEQALEICDALARSGAVDVIVVDSVAALTPKAEIEGEIGDSHMGLAARMMSQAMRKLAG 180

2000-182446/16. N-PSDB; AAZ60610. Evolution of whole cells and organism by iterative cycles of recombination and selection and screening for acquisition of desired

Example 1; Fig 13; 197pp; English.

The present sequence represents a hyperrecombinogenic recA protein. The wild type recA protein (AAY68827) was used to produce hyperrecombinogenic variants, using the method of the invention. The specification describes a method for producing a library of diverse multicellular organisms using pools comprises a number of different gametes derived from different strains of a species or of a different species. The viable organisms produced from the fertilized gametes are repeatedly crossed to produce a library of diverse organisms, which are selected for a desired trait or property. The methods can be used to evolve cells to acquire a desired property. The methods can be used to evolve cells to acquire a desired property such as heat tolerance, ethanol production or tolerance, acid, improved glucose transport. The desired property may be expression of a protein or primary or secondary metabolite. Alternatively the desired property is secretion of a protein or secondary metabolite, chosen from taxol, cyclosporin A and erythromycin. The desired property may be a capacity for meiosis or compatibility to form a heterokaryon with another

Sequence 358 AA;

The invention relates to a method of evolving cells to acquire a desired property by forming protoplasts of different cells fushing the protoplasts of protoplasts incubating the hybrid protoplasts from the protoplasts from the protoplasts from protoplasts recombine to form additional hybrid genomes and concerned cells, fushing protoplasts to form additional hybrid genomes and incubating additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional fregenerated cells. The invention also relates to a method of producing a library of diverse multicellular organisms involving providing a pool of the female gametes and a pool of fleferent strains of a species or different species and the male gametes fertilise the female gametes by permitting at least a portion of the resulting fertilised gametes to grow into reproductively viable organisms to produce a library of diverse organisms and selecting the library for a desired trait or property. The methods are useful for evolving cells to acquire desired properties such as heat tolerance, ethanol production, changing the cofactors, improved production and maintenance of enzyme cofactors, improved production and maintenance of any protein, primary metabolite or secondary metabolite, the secretion of a protein or Disclosure, Fig 13; 196pp; English. Becondary metabolite, capacity for meiosis or compatibility to form a heterokaryon with another strain. The secondary metabolite is chosen from taxol, cyclosporin A and erythrowycin. The method is also useful for acquisition of desired properties such as enhanced recombinosenicity, gene copy number or gene reductivity and capacity for expression and/or secretion of proteins or secondary metabolites. The method is further useful for predicting efficacy of a drug in treating viral infection, plant genome shuffling, micropore manipulation, producing transgenic animals, improvement of overexpressed genes for a desired phenotype and reiterative pooling and breeding of higher organisms. The cells evolved by the method are useful in molecular genetics. This sequence represents an E. coli recA protein clone used in the method of the invention.

Comparate to form hybrid protoplasts, incubating cells, tusing the protoplasts to form hybrid protoplasts, incubating the hybrid protoplasts or protoplasts to form hybrid protoplasts from to produce regenerated cells, fusing protoplasts to form hybrid protoplasts from to produce regenerated cells, fusing protoplasts to form hybrid protoplasts from protoplasts are ecombine to form additional hybrid genomes and connected cells. The invention also relates to a method of producing a incubating additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing additional hybrid protoplasts for producing a match of producing a library of diverse multicellular organisms, involving providing a pool of the female pool comprises several different gametes derived from a fartilise the female gametes, where one of the male gametes fertilise the female gametes or different species and the male gametes of fertilise the female gametes to grow into reproductively viable organisms to produce a library of diverse organisms and selecting the library for a desired trait or property. The methods are useful for evolving cells to congaried trait or property. The methods are useful for evolving cells to congaried properties such as heat tolerance, ethanol production, cethanol tolerance, improved production and maintenance of enzyme conferced properties such as heat tolerance, ethanol production, conference improved production and maintenance of enzyme conference, improved production and maintenance of enzyme conference, improved production and maintenance of enzyme condary metabolite or secondary metabolite is chosen from the econdary metabolite or secondary metabolite or generation of proteins or secondary metabolite. Capacity for metabolite such and ergulation, producing engale dropperties such as drug in treating viral infection of protein acquire a desired Evolving cells to acquire a desired property, by forming protoplasts of different cells, fusing protoplasts to form hybrid protoplasts (HP), producing regenerated cells, forming additional HP and producing additional regenerated cells. The invention relates to a method of evolving cells to Disclosure; Fig 13; 196pp; English. WPI; 2004-507924/49. N-PSDB; ADQ87819 Sequence 358 AA;

ROBCA
recombination protein recA [validated] - Escherichia coli (strain K-12)
N;Alternate names: recombinase A
C;Species: Escherichia coli
C;Species: Bacherichia coli
C;Species: 1-Uul-1800 #sequence revision 14-Nov-1997 #text change 09-Jul-2004
C;Accession: G65049; A93847; A93846; S11931; S63525; S69129; S63979; A03548
R;Blattner, F.R.; Plunkett III, G.; Bloch, C.A.; Perna, N.T.; Burland, V.; Riley, M.; C, Science 277, 1453-1462, 1997
A;Title: The complete genome sequence of Escherichia coli K-12.
A;Reference number: A64720; MUID:97426617; PMID:9278503

A; Accession: G65049
A; Status: nucleic acid sequence not shown; translation not shown
A; Accession: G65049
A; Status: nucleic acid sequence not shown; translation not shown
A; Molecule type: DNA
A; Residues: 1-353 cBLAT>
A; Cross-references: UNIPROT: P03017; UNIPARC: UP10000112C1C; GB: AE000354; GB: U00096; NID
A; Experimental source: strain K:12, substrain MG1655
A; Cross-references: UNIPROT: P0304, H.; Ogawa, T.

A; Molecule type: DNA A; Residues: 2-353 <SAN>

A;Cross-references: UNIPARC:UP10000112C17; GB:V00328; GB:J01672; NID:g42672; PIDN:CAA23 R;Zhao, X.J.; McEntee, K.
Mol. Gen. Genet. 222, 369-376, 1990
A;Title: DNA sequence analysis of the recA genes from Proteus vulgaris, Erwinia carotov A;Reference number: S11931; MUID:91109725; PMID:2274037
A;Accession: S11931
A;Molecule type: DNA

A;Residues: 2.353 <ZHA>
A;Cross-references: UNIPARC:UPI0000112C17; GB:X55552; NID:942678
A;Note: this ORF is not annotated in GenBank entry ECRECAGEN, release 109.0
